

# PRIME CARBON INFORMATION PORTAL

Prime Carbon is working with Object Consulting to provide an Information Portal for its offset generation methodologies which will give transparent access to key data to Landholder participants, Market participants and other interested parties.

Prime Carbon is developing a series of methodologies which it proposes to use to configure Carbon Offsets under the Carbon Farming Initiative (CFI) and/or the National Carbon Offset Standard (NCOS). An element in these methodologies is the provision of a transparent platform for recording information about the program and about offsets which may arise from such a program. The Prime Carbon Information Portal is one way Prime Carbon proposes to deliver transparency under its methodologies. The final configuration of these offsets is subject to approval under the CFI or NCOS and the configuration may vary when regulations for the implementation of either CFI or NCOS or both are released and/or after assessment of the configuration methodologies by the relevant authorities.

Through a strategic alliance with Object Consulting, Prime Carbon is developing a data management platform tailored to the fundamental workflows and reporting requirements of the Prime Carbon Soil Enhancement and Carbon Sequestration Program (SECS) and other methodologies for carbon offset generation which Prime Carbon is proposing.

The Prime Carbon Information Portal will provide a flexible repository for the storage and traceability of all data associated with the SECS, with complete audit transparency. A key driver will be guaranteed data integrity underpinning the integrity of offsets. Various automated data feeds will be maintained for captured data and location information to assist in eliminating discrepancies and uncertainties.
